Proposed Model of the Neurobiological Mechanisms Underlying Psychosocial Alcohol Interventions: The Example of Motivational Interviewing*

SARAH W. FURBER EWING, Ph.D.,¹ FRANCESCA M. FIDRY, Ph.D.,² CHRISTIAN S. HEDDERSHIEB, Ph.D.,¹ AMBER D. MEACHAM, Ph.D.,¹ AND KENNETH E. HUETTERON, Ph.D.¹

Alcohol Research Journal, Annals of the New York Academy of Sciences, 1217, 146-154, 2011 JSAAD, 2011

Neurobiology of the Effects of Substance Use Disorder Treatments

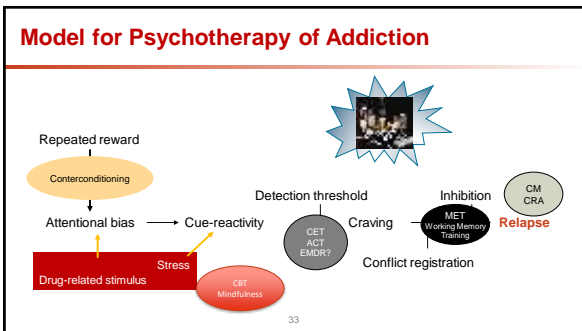

Abstract: Objectives: This study examined the neurobiological mechanisms underlying the effects of Motivational Interviewing (MI) on alcohol use. Methods: A sample of 100 individuals with alcohol use disorder was recruited from a community-based setting. Results: MI was associated with a decrease in cue-reactivity and craving, and an increase in inhibition. These changes were associated with a decrease in alcohol use. Conclusions: MI may be effective in reducing alcohol use by altering neurobiological processes related to cue-reactivity and craving.

ACER, 2011

32

33

- ### Conclusion about Available Interventions
- Many pharmacological interventions for alcohol, nicotine and opioid dependence
 - Very few pharmacological interventions for stimulant and cannabis dependence
 - Very few pharmacological interventions for PG
 - Many psychological interventions for all addictions
 - Maybe some neuromodulation opportunities in the future
 - **BUT**
 - How effective are these interventions?

34

36

Pharmacotherapy for Adults With Alcohol Use Disorders in Outpatient Settings: A Systematic Review and Meta-analysis

Systematic review with 123 RCTs (n=22,803)
Meta-analysis with 95 RCTs, including N=27 acamprostate RCTs (n=7,519) and N=53 naltrexone RCTs (n=9,140)

Results
 Acamprostate: Abstinence RD=9% → **NNT=11**
 Heavy drinking RD=5% → **NNT=20**
 Naltrexone: Abstinence RD=1% (ns)
 Heavy drinking RD=9% → **NNT=11**
In direct comparison no difference between acamprostate and naltrexone

37

39

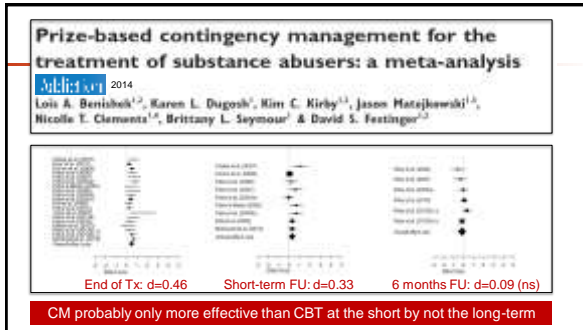

40

Effectiveness of Addiction Tx Psychotherapy

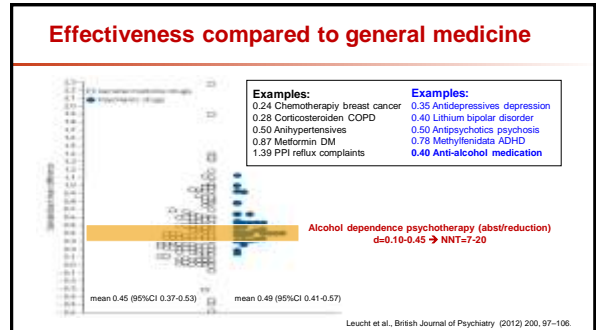

41

42

43

44

Conclusion Effectiveness Interventions

- Interventions are consistently effective at the group level, but effect sizes are small to moderate at best and NNTs are generally >7-10
- This means that many patients in treatment continue to suffer from excessive alcohol/drug use and the side-effects related to treatments
- The question is whether we can do better and how?

45

Improving Treatment Effectiveness

46

How can we do better?

Possible solutions

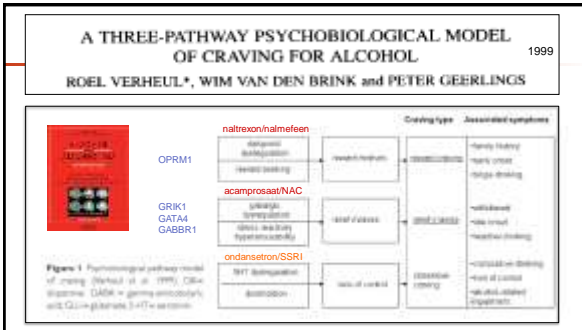

- Improve compliance: psychotherapy, long-acting formulations
- Combine pharmacotherapy with psychotherapy
- Combine different medications: polypharmacy
- New medications: based on basic science, "repurposing"
- Patient-treatment matching: precision/personalized medicine**
- * phenotype, endophenotype, genotype, tx process**
- New treatment modalities, e.g. neuromodulation

47

Different types of matching variables

Characteristic	Phenotype	Endophenotype	Genotype
Stability	Low-Moderate	Low-High	High
Feasibility	High	Low	High
Price	Low	High	Moderate → Low
Biological process	Distant	Close	Close
Psychological process	Close	Distant	Distant

48

49

50

**Precision/Personalized Medicine
Pharmacotherapy
Alcohol Dependence
Phenotype**

51

Predictors of acamprosat efficacy: results from a pooled analysis of seven European trials including 1485 alcohol-dependent patients

2005

	Predictor (P)	Interaction P x Tx
Severity Physical Dependence	P=0.155	P=0.975
Severity Craving	P<0.000	P=0.626
Positive Family History of Alcoholism	P=0.301	P=0.294
Age of Onset Alcohol Problems	P=0.519	P=0.599
Anxiety at Baseline	P<0.000	P=0.705

Phenotypical characteristics (craving, anxiety) do predict course, but they do NOT predict treatment effect

52

Baclofen for the Treatment of Alcohol Dependence and Possible Role of Comorbid Anxiety

0/0 high activity genotype: No effect on any drug (11%)

0/1 high activity genotype: 50% extra success of active drug (15%)

1/1 high activity genotype: 50% extra success of active drug (15%)

82

Serotonergic gene variation in substance use pharmacotherapy: a systematic review

Pharmacogenetics 2013 July; 23(11):1-8

Habibeh B Bauer¹, David P O'Grady², Jair C Soares¹, and David A Nielsen³

Executive summary

- Pharmacogenetics is a promising field that has the potential to improve patient care and reduce healthcare costs related to drug addiction.
- Genetic variability of the serotonergic biosynthesis enzyme tryptophan hydroxylase 2 (TH2) and the serotonin transporter (SLC6A4) genes modulates the efficacy of several addiction treatments, such as mianserin, divalproex and the antidepressants bupropion, venlafaxine and nortriptyline.
- More research is needed to identify additional serotonergic gene variants that predict the success of treatments, their clinical outcomes and potential side effects of therapeutic interventions for drug addiction.

85

A review of pharmacogenetic studies of substance-related disorders*

Drug Alcohol Depend 2019 July 1; 192: 1-14

Jermaine D. Jones^{1,†} and Sandra D. Comer²

Results—Findings from these studies provide **preliminary** evidence of clinically relevant pharmacogenetic effects. However, independent **replication of these findings has been sparse.**

Conclusions—Although this growing body of literature has produced **promising results**, improved statistical controls may help to clarify the findings. Additionally, the use of empirically derived sub-phenotypes (i.e., which serve to differentiate distinct groups of affected individuals) may also help to identify genetic mediators of pharmacologic response in relation to SUDs. The identification of genetic mediators can inform clinical care both by identifying risk factors for SUDs and predicting adverse events and therapeutic outcomes associated with specific pharmacotherapies.

Matching Alcoholism Treatments to Client Heterogeneity: Treatment Main Effects and Matching Effects during Treatment*

PROJECT MATCH RESEARCH GROUP¹

ABSTRACT Objective: This article examines client drinking and relapse post-treatment following 12-week of alcoholism treatment. We focused on (1) the main effects of the three Project MATCH treatments, (2) the magnitude of client matching on the matching hypothesis, and (3) the ability to measure treatment effects. Methods: Clients enrolled from outpatient settings in 1992 or from aftercare settings in 1994 were randomized to one of the following treatments: Motivational Enhancement Therapy (MET), Cognitive Behavioral Therapy (CBT), and Twelve-Step Facilitation (TSF). Alcohol consumption and 10 clinical functioning study measures were assessed in six of the 12-week treatment phases. Results: During the treatment phase, most had statistically significant differences among treatments, with CBT only on the composite score in treatment of alcohol consumption and alcohol-related negative consequences. There was no main effect of CBT or TSF (both were almost identical) on any of the 10 clinical functioning outcomes, composite score, or MET status. There was a significant primary client-treatment matching by outcome effect on all 10 clinical functioning outcomes, composite score, and MET status. There was no significant matching effect on any of the 10 clinical functioning outcomes, composite score, or MET status. There was a significant matching effect on the composite score in treatment of alcohol consumption and alcohol-related negative consequences, it was that CBT or TSF showed in the treatment of clients. (*J Stud Alcohol DRUG Depend* 1998; 19(8): 1000-1008).

Large study (n=1,726) comparing the effect of 3 different types of psychotherapy (MET, CBT, TSF) and testing 10 a priori matching hypotheses using phenotypic patient characteristics

- * No clinically relevant differences in the effect of the 3 different interventions
- * No clinically meaningful patient-treatment matching effects

88

91

Working alliance and outcome in youth addiction and MH Tx
 Van Benthem et al., in preparation

Prospective study of 127 adolescents in addiction and MH Tx
 * pre-Tx assessment with Working Alliance Inventory for therapists and patients
 * outcomes in terms of Sxx and drug use

Results:

Youth	Therapist	Responders
Weak	Weak	26 %
Weak	Strong	45 %
Strong	Weak	35 %
Strong	Strong	74 %

Outcome much better if mutual working alliance strong → training and/or switch!

92

Conclusions

93

- Conclusions**
- Addiction is (also) a treatable brain disease
 - New pharmacological treatments with limited effect size
 - Polypharmacy and/or personalized treatments are needed
 - Interesting precision/personalized medicine findings in alcohol and nicotine dependence that can be used for patient-treatment matching in clinical practice
 - Larger (replication) studies with well-designed treatments and control for multiple comparison are needed.

94

Thank You
